

(a) one variable, two stories

```
def f(xs):  
    sum_all = len(xs)  
    ww = sum_all + 3  
    qq = ww + 4  
    return qq  
f([5, 3])
```

the code says `sum_all = len(xs) = 2`
the name says `sum_all = sum(xs) = 8`

the call returns 9

(b) what the model then writes

worked examples write “v = 3”

`sum_all = 8, ww = 11, qq = 15`

answers 15 (wrong)

worked examples write “v = len(xs) = 3”

`sum_all = len(xs) = 2, ww = sum_all + 3 = 5, qq =`

answers 9 (correct)

*Same problem, same model, same three worked examples.
Only the format of those examples differs.*

(c) across models, 3 example sets
