

Showing the operation changes this wrong trace to a correct one

Task: write each assigned value, then the function's final answer.

Same program and input

```
def f(xs):  
    sum_all = len(xs)  
    ww = sum_all + 3  
    qq = ww + 4  
    return qq  
f([5, 3])
```

len counts items: 2

sum_all suggests $5 + 3 = 8$

Correct final answer: 9

Examples show values

name = value

Actual OLMo-2-7B output:

sum_all = 8

ww = 11

qq = 15

Answer: 15 (wrong)

Examples show operations

name = operation = value

Actual OLMo-2-7B output:

sum_all = len(xs) = 2

**ww = sum_all + 3
= 5**

**qq = ww + 4
= 9**

Answer: 9 (correct)

Only the worked-example format changes; the model solves the same program.
